

MCS D COVID - 19 TESTING PLAN

COVID - 19 Testing

The Millbrook CSD will comply with CDC guidance and not conduct COVID-19 testing or require testing or antibody testing of students or staff members. The decision of whether a test needs to be conducted will be determined by a healthcare provider or the local department of health. In addition, the Millbrook CSD will collaborate with the Dutchess County Department of Behavioral and Community Health and recommends their [testing resources](#).

Testing is readily available in our community. Students, staff, or visitors requiring COVID-19 testing should contact their health provider, a local urgent care, federally qualified health center or visit the NYSDOH website to locate a nearby testing facility <https://coronavirus.health.ny.gov/find-test-site-near-you>.

Dutchess County Department of Health / Millbrook CSD - COVID-19 Testing Procedure

Background

COVID-19 remains a serious public health threat to the residents of Dutchess County, NY. Recently, the Governor of New York State has approved that both public and private K-12 schools will be able to open for the upcoming school year and was given guidance documents to develop plans to safely re-open with many COVID-19 mitigations. One of those mitigations is to have a plan for COVID-19 testing for individuals in a school setting. Information about testing in Dutchess County is described below.

Symptoms of COVID-19 Symptoms of COVID-19 may appear 2-14 days after exposure and include: fever or chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, and diarrhea.

Types of COVID-19 tests There are two different types of tests – diagnostic tests and antibody tests.

- A diagnostic test can show if you have an active coronavirus infection and should take steps to quarantine or isolate yourself from others. Currently, there are two types of diagnostic tests which detect the virus – molecular tests, such as RT-PCR tests, that detect the virus’s genetic material, and antigen tests that detect specific proteins on the surface of the virus.
- An antibody test looks for antibodies that are made by your immune system in response to a threat, such as a specific virus. Antibodies can help fight infections. Antibodies can take several days or weeks to develop after you have an infection and may stay in your blood for several weeks or more after recovery. Because of this, antibody tests should not be used to diagnose an active coronavirus infection. At this time researchers do not know if the presence of antibodies means that you are immune to the coronavirus in the future.

How to be Tested for COVID-19

1. Contact your primary care physician to receive a prescription to visiting a testing site;
2. or Contact a testing site to schedule an appointment.
